Pre-Construction Anti- Termite Treatment

Prevent termite infestation

Thesoil in immediate contactwith the foundation and floor structure of the building is treatedwith Premise, therebycreating chemical barrier zone. Termites cannot detect barrier of Premise and come in contact with it. They spread the non-repellent insecticide to other members of colony which may lead to colony elimination.

TREATMENT FOR RCC FOUNDATION (BUILDINGS WITH BASEMENTS)

1. **Treatment of soil below raft**

1. Treatment for building with basement starts after the excavation for basement is complete and before laying soling and Plinth Cement Concrete.
2. Before laying the rubble soling and Plinth Cement Concrete, the compacted and levelled soil shall be treated at the rate of 5 lit./m2

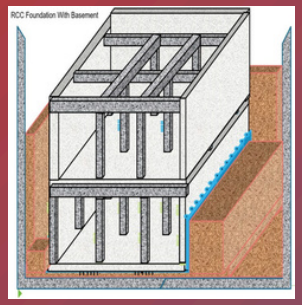

Blue mark represents the Premise® treated area

2. Treatment of soil along the retaining walls

Treatment during soil back filling stages

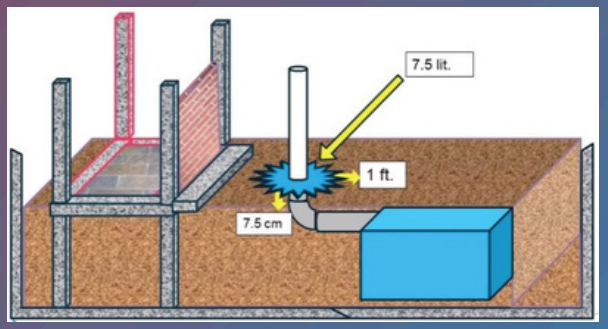

Virtual representation of chemical barrier (Blue mark) after completion of soil backfilling

Blue mark represents the Premise® treated area

1. The soil retained by the walls (soil coming in contact with retaining wall) shall be treated at the rate of 7.5 lit./m2 of the vertical surface so as to maintain the continuity of chemical barrier with that of the one formed below that raft.
2. The treatment shall follow the backfilling which is done in stages to a depth of 30 cm, but not exceed backfilling height above 1 metre.
3. Rodding may be carried out to facilitate the treatment.

3. Treatment of Soil Surrounding Pipes, Wastes and Conduits

Blue mark represents the Premise® treated area

1. When pipes, wastes and conduits enter the soil inside area of the foundations, soil surrounding the point of entry shall be loosened around each such pipe, waste or conduit for a distance of 150 mm and to a depth of 75 mm before treatment is commenced.
2. When pipes, wastes and conduits enter the soil external to the foundation, they shall be similarly treated at a distance of over 300 mm unless they stand clear of the walls of the building by about 75 mm. Chemical emulsion to be poured at the rate of 7.5 lit./m2 of vertical surface.

4. Treatment of Soil Along External Perimeter of Building

1. A er the building is complete, the earth along the external perimeter of the building should be rodded at intervals of 150 mm and to a depth of 300 mm.
2. The rods should be moved backward and forward parallel to the wall to break up the earth.
3. Chemical emulsion should be poured along the wall at the rate of 7.5 lit./m2 of the vertical surface.
4. In the event of lling being more than 300 mm, the external perimeter treatment shall extend to the full depth of lling up to the ground level so as to ensure continuity of the chemical barrier.

HOSPITALS

Hospital pest control is a critical process focused on eliminating pests such as rodents, cockroaches, flies, and mosquitoes within healthcare facilities. Effective management is essential to preventing disease transmission and maintaining a sterile, hygienic environment for patients, staff, and visitors.

At Best Serve, we provide customized, scientifically driven solutions that prioritize both environmental responsibility and regulatory compliance. Our expertise ensures a safe, pest-free healthcare setting, safeguarding the well-being of all.

FOOD OUTLETS/ RESTAURANTS

Maintaining a pest-free environment in restaurants is essential for food safety, regulatory compliance, and brand reputation. Specialized pest control targets common threats like cockroaches, rodents, and flies, ensuring a clean, hygienic space for both customers and staff. Proactive management helps prevent health inspection failures and upholds industry standards.

BUILDERS AND CORPORATE

Protecting builders and software from pests is crucial because pests can cause significant physical damage to structures and disrupt software operations. For builders, pests can damage building materials, weaken structural integrity, and increase maintenance costs. Additionally, safeguarding software from pests ensures accuracy in data-driven decisions, enhances efficiency, and helps optimize resource allocation. This protection supports compliance with safety and regulatory standards critical for public health and long-term client trust.
